

OUTLIERS

LinkChat

Your LinkedIn conversations, and the sequences that run off them,
on your own computer — through the CRM you already built.

EST. MMXXVI • OUTLIERS ACCELERATOR

What it is, and what it keeps

Five screens over the CRM you built in Sessions 0 to 2. It reads your LinkedIn inbox onto this computer, shows you what is waiting, and carries a message into a conversation once you have approved it.

WHAT IT DOES NOT HOLD

LinkChat keeps no record about a person. Your people, your event log, your daily limit and your do-not-message list all stay in your CRM, and LinkChat reads them from there through one file. Point it at a different CRM and everything it knows changes, because it knew none of it.

That is why there is nothing to export if you stop using it, and why two copies of LinkChat pointed at one CRM cannot disagree about who you have messaged today.

THE FIVE SCREENS

Home	Conversations	Sequences	Campaigns	Live
What is waiting, and one next step worked out for you.	Your LinkedIn inbox, read onto this computer.	What you say when somebody replies, and to which reply.	Connection requests, withdrawals, reading a saved search.	What your CRM has recorded, newest first.

NOTHING HAPPENS ON ITS OWN

LinkChat runs when you press something. There is no clock in it and no job waiting to fire while you are away. A message goes when you press Send or approve one, and a copy is written into your outbox before it is carried, so a send that fails still leaves you the words.

Getting it onto your computer

Four steps. Every command below is typed into a terminal: on Windows press Start, type `cmd` and press Enter; on a Mac press Command and Space, type Terminal and press Enter.

ONE • COPY THE PROGRAM DOWN

```
cd %USERPROFILE%\Documents
git clone https://github.com/ashleydeansmith/linkchat.git LinkChat
```

On a Mac the first line is `cd ~/Documents` instead. You now have a folder called `LinkChat` inside Documents. If that second line comes back saying the repository could not be found, the copy you were pointed at is not open to you — say so, it is one setting at the other end.

TWO • RUN THE INSTALLER

Open `Documents\LinkChat` in File Explorer and double-click `setup.cmd`. On a Mac, double-click `setup-mac.command`. It prints four lines as it goes and takes about five minutes, most of it downloading the browser.

THREE • DOUBLE-CLICK THE ICON IT LEAVES ON YOUR DESKTOP

LinkChat opens in its own window and asks where your CRM is.

IF ANY OF THAT DOES NOT GO AS WRITTEN

In the terminal, move into the folder and ask the program what it can see. It reports which computer this is, which installer belongs to it, which Python you have and whether it is one of the two impostors, which parts are installed, whether the browser downloaded, and whether it has been pointed at a CRM — then one line saying what to do next. It looks only: it installs nothing, changes nothing and sends nothing.

```
cd %USERPROFILE%\Documents\LinkChat
python doctor.py
```

Pointing it at your CRM

Asked once, the first time you open it. Two boxes.

Point LinkChat at your CRM

LinkChat keeps no record about a person. Your people, your event log, your daily limit and your hold list all stay in the CRM you built, and LinkChat reads them from there.

The folder your CRM is in

It is the folder with `_engine` and `People` inside it — the one Layer 1 made.

Your name

This goes on the approval line. A sequence writes a message and cannot approve its own work, so every message that reaches your outbox carries the name of the person who said it could: you.

CancelUse this CRM

THE PANEL IT OPENS WITH

Your name is the box people skim past. It goes on the approval line: a sequence writes a message and cannot approve its own work, so every message that reaches your outbox carries the name of the person who said it could.

WHAT IT GOES LOOKING FOR

Eight parts of your CRM, by name: the part that checks a message before it goes, your do-not-message list, your daily limit, your event log, your review step, the part that works out that one person is one person, the part that knows where your folders are, and the lock that stops two jobs driving the browser at once. Any that are missing are named on the screen, and what LinkChat can do shrinks to match — rather than failing at the moment you press something.

If your CRM has not reached Layer 6, LinkChat opens anyway and reads everything. It will not send until Layer 6 is installed, and it says so on the screen rather than refusing to open.

What is waiting, and one next step — not a list of options, one step, worked out from what is actually true right now.

The strip along the top is on every screen: whether you are signed in to LinkedIn, whether it is reading, how much of today's limit is left, and how many conversations are on this computer.

Waiting on a reply is the count that matters most days — conversations where they said something last and you have not answered. **Have agreed words** counts the ones your sequence recognises and has a message ready for. **Waiting for you to approve** is the review step.

Conversations

Your LinkedIn inbox, read onto this computer. Pressing Sync inbox is also what opens the browser the first time, and that is where you sign in — once, on this computer.

THE BOXES ON THE LEFT NARROW THE SAME LIST. THE NAMES ARE INVENTED

ONE CONVERSATION, OPEN: THE THREAD, A PRIVATE NOTE, THE REPLY BOX

What you type in the reply box goes into the conversation when you press **Send** — and a copy is written into your outbox first, so a send that fails still leaves you the words. The note on the right is yours alone and never leaves this computer.

Every message takes one road out, whoever wrote it. Five things have to be true before a single character reaches anybody. A message a sequence wrote faces a sixth: the review step in your CRM, which a sequence cannot release itself.

Profile

Hide details

Hi Priya - saw you're running things on your own. Have you built yourself a second brain yet, or is it still all in your head?

No, we haven't built anything like that yet.

Hi (name), saw you built {their build} - how is that going?

Send

Ctrl+Enter sends · a copy is written to your outbox first

this still has (name), {their build} in it, which is a gap nothing filled in. Write the words in yourself, or pick somebody the record is complete for.

A check that refuses is the check working. Read the sentence it gives you and fix what it names. Do not look for a way around it.

Sequences

What you say when somebody replies, and to which kind of reply. Press Start from the shape and you get this rather than a blank canvas.

THE STARTER SHAPE: ONE OPENER, FOUR WAYS BACK

The two groups that feel like failures are the two largest. **No reply at all** and **a pleasantry and nothing else** are where most people end up, and where a written answer is worth the most, because at the moment you have none.

EVERY MESSAGE IN IT IS A GAP

Nothing in the starter shape contains words you could send. Every message body is something for you to write, and the third check physically refuses a message with a gap left in it. Handed real copy, you could send five messages you had never read. This way you cannot.

Campaigns

Where conversations come from. Everything else works on people who have already replied — this is the part that reaches out.

LinkChat

Sign in to LinkedIn — press Sync inbox and a browser opens on the login page · Not reading · Today: 0 of 20 · 7 conversations on this computer

0 people · 20 of 20 left today, shared with Gather · a message goes when you press Send or approve one; a copy is written to your outbox first

Campaigns

Where conversations come from. Everything else in LinkChat works on people who have already replied — this is the part that reaches out. Each of these answers to the daily limit in your own CRM, the same one Gather answers to.

- Look through a saved search**
 Reads a Sales Navigator saved search and puts the people into your queue. Nothing is said to anybody.
 0 of 20 used so far
 Practice Do it
- Ask people to connect**
 Sends connection requests from your queue. A request carries none of your words. LinkedIn counts these, so they answer to your daily ceiling.
 0 of 20 used so far
 Practice Do it
- Take back requests nobody answered**
 Withdraws old requests. Worth doing often - a pile of unanswered ones is what makes LinkedIn tighten your limits.
 0 of 20 used so far
 Practice Do it
- Work out who said yes**
 Checks who accepted and writes it into your records. Reading only; nothing is said to anybody.
 0 of 20 used so far
 Practice Do it

YOUR PUSHES

None yet. Look through a saved search and the people it finds land in a queue here, ready for connection requests.

Your CRM

FOUR JOBS, EACH WITH PRACTICE AND DO IT

Practice does everything except the outward action and tells you what it would have done. **Do it** does it. Nothing on this screen presses Do it for you.

ONE LIMIT, NOT TWO

Each job reads the same daily limit in your CRM that Gather reads. LinkedIn counts the account, not the program, and two programs each keeping their own tally is how both stay inside a limit while the account goes over it.

One consequence worth knowing: that limit is shared across all four jobs and your messages. Message twenty people and reading a saved search will refuse too, until tomorrow.

Live

What LinkChat is doing now, and what your CRM has recorded. Read from your own event log — nothing on this screen sends or changes anything.

NEWEST FIRST, OUT OF YOUR OWN EVENT LOG

These lines are written by your CRM, not by LinkChat, which is why they are still there if you stop using LinkChat entirely.

An entry naming no person means the record could not be matched to somebody in your CRM at the moment it was written. It is shown rather than hidden, because a screen that quietly drops what it cannot explain is a screen you cannot trust about anything else.

When something is wrong

Four things go wrong more often than anything else. Each has one answer.

NOTHING OPENS WHEN YOU DOUBLE-CLICK THE ICON

Run the doctor. The most common cause is Python installed without **Add python.exe to PATH** ticked, and the doctor says so in those words.

```
cd %USERPROFILE%\Documents\LinkChat
python doctor.py
```

IT SAYS THE BROWSER IS NOT STARTED

Go to Conversations and press **Sync inbox**. That is what opens it. A window appears on the LinkedIn login page, and it can open behind the LinkChat window, so check your taskbar. Sign in once, come back, press Sync inbox again.

IT SAYS YOUR CONVERSATIONS FILE IS DAMAGED

Close LinkChat, move the file it names somewhere else, and open LinkChat again. It builds a new one and reads your inbox back in. Your people, your outbox and your records are separate files and are untouched.

GETTING THE NEWEST VERSION

```
cd %USERPROFILE%\Documents\LinkChat
git pull
```

Your CRM is a different folder, so nothing you have written is touched.

CHANGING IT YOURSELF

The whole program is there and you can change any part of it. A file called `CLAUDE.md` in the folder is read by Claude Code on its own, and is mostly a list of what must never be changed: none of the five checks may be weakened, widened or worked around, and the file that talks to your CRM is not to be edited. A fix that seems to need one of those loosened is the point to stop and ask.
